

# NUTRITION TO HELP WITH KIDNEY PROBLEMS

The kidneys manage waste and water exit for the body. They adjust the levels of salt and calcium and they make sure useful elements remain in the blood. The kidneys also move protein waste, excess minerals and water into the urine where they can be disposed of. In patients with kidney disease these functions are impaired

## HOW CAN DIET HELP?

Diseased kidneys cannot be repaired but a food that reduces the amount of waste the kidney has to dispose of can help slow down the weakening of the kidney function and it can also improve

## SPECIFIC™ HEART & KIDNEY SUPPORT

A choice of wet and dry diets for dogs with reduced heart, kidney and/or liver function.

- High levels of omega-3 from fish and krill support heart rhythm and normal blood pressure
- Reduced protein content reduces workload on the kidney combined with proteins of high biological value to ensure your dog gets the nutrients it needs
- High levels of omega-3 and restricted phosphorus content support kidney function
- L-carnitine and taurine support the heart function
- Reduced salt content will support healthy blood pressure
